

New NISA Adoption and the Opportunity for Japanese Brokerage Firms

A pre/post-2024 analysis of retail-investor participation, younger cohorts, household allocation
and firm implications

Research report

Data through final 2025 NISA statistics; selected 2026 context

Prepared August 2026

Companion workbook: NISA_Research_Project_Final.xlsx

Every numerical source, formula, assumption, variable definition and audit check is documented in the workbook.

Executive Summary

Research question. How much did Japanese retail-investor participation increase around the 2024 expansion of NISA, particularly among younger investors, and what does that growth imply for Japanese financial institutions and firms?

Answer. The evidence supports a substantial and persistent acceleration in measured retail participation around the 2024 New NISA launch. Final all-institution NISA accounts increased from 21.25 million at year-end 2023 to 25.59 million in 2024, a 20.4% increase, and reached 28.21 million in 2025. Securities-company NISA purchases increased from ¥3.8488 trillion in 2023 to ¥14.0447 trillion in 2024, a 264.9% increase, and remained elevated at ¥15.3540 trillion in 2025. [S02; S03; S06; S07]

The age evidence supports the younger-investor hypothesis with an important qualification. The merged <=20s cohort had the fastest 2023-to-2024 account growth at 32.7%, while direct 2025 penetration was highest among people in their 30s at 37.3%. However, the 50s cohort also grew 25.5% in 2024, so the evidence is better described as broad working-age diffusion with especially strong younger adoption, rather than a strictly monotonic relationship between age and growth. [S02; S04; S06; S07]

For financial institutions, the economic opportunity is broader than transaction commissions. New NISA increases the value of scalable customer acquisition, recurring investment-fund balances, custody and deposited assets, cash and interest economics, foreign-exchange and ancillary activity, advisory relationships and fund manufacturing. Rakuten Securities and SBI Securities show the clearest direct digital exposure in disclosed data; Nomura and Daiwa show meaningful exposure through recurring/advisory assets and NISA-eligible fund flows. [S22-S31]

Causal limitation. The project does not claim that New NISA alone caused the full observed increase. The reform simultaneously raised statutory contribution limits, while Japanese equities performed strongly and Bank of Japan policy normalized. Household asset-stock changes also contain valuation and reconciliation effects. The defensible conclusion is therefore that the reform was associated with a pronounced structural break in measured participation, not that every additional account or yen invested can be causally attributed to the policy. [S01; S05; S09-S21]

Metric	Pre / Baseline	Post / Current	Interpretation
All-institution accounts	21.25m (2023)	25.59m (2024); 28.21m (2025)	+20.4% in launch year; +32.8% over two years
Securities-company accounts	14.28m (2023)	18.03m (2024); 20.25m (2025)	+26.3% in launch year; +41.8% over two years
Securities-company annual purchases	¥3.8488tn (2023)	¥14.0447tn (2024); ¥15.3540tn (2025)	+264.9% in launch year; persisted in 2025
<=20s accounts	2.31m (2023)	3.07m (2024); 3.50m (2025)	+32.7% in 2024; +51.4% vs 2023

Sources: final NISA statistics [S02, S03, S06, S07]; age accounts [S02, S06, S07]; penetration [S04].

Hypothesis Verdicts

H1 - New NISA materially accelerated participation: Supported. Both account stocks and annual securities-company purchase flows show a marked break in 2024 relative to the recent pre-reform trend. [S02-S07]

H2 - Younger investors adopted proportionally more: Supported with qualification. The youngest merged cohort led launch-year account growth, and 20s-40s show high/rapid penetration. The 50s cohort also performed strongly, preventing a simple monotonic age gradient. [S02; S06; S07]

H3 - Digital / recurring-investment firms are positioned to benefit: Supported with qualification. Rakuten and SBI show direct customer/NISA/AUM evidence. Nomura and Daiwa also benefit through recurring assets, advice and product manufacturing, but disclosure definitions prevent an exact cross-firm ranking. [S22-S31]

1. Institutional Background: What Changed in 2024?

The 2024 reform transformed NISA from two time-limited, mutually exclusive adult programs into a permanent two-quota system with materially larger tax-exempt capacity. Under the pre-2024 system, General NISA allowed up to ¥1.2 million of annual purchases with a five-year tax-exempt holding period, while Tsumitate NISA allowed ¥0.4 million annually with a twenty-year tax-exempt period. New NISA permits both an annual ¥1.2 million accumulation quota and a ¥2.4 million growth-investment quota, for a combined ¥3.6 million annual limit, an indefinite tax-exempt holding period and a ¥18 million lifetime book-value holding limit. [S01; S35]

Feature	General NISA (through 2023)	Tsumitate NISA (through 2023)	New NISA (from 2024)
Annual investment capacity	¥1.2m	¥0.4m	¥3.6m total: ¥1.2m accumulation + ¥2.4m growth
Tax-free holding period	5 years	20 years	Indefinite
Program access	Choose General or Tsumitate in a year	Choose Tsumitate or General in a year	Both quotas can be used
Lifetime / total tax-free holding limit	Effectively constrained by annual limit and five-year window	Effectively constrained by annual limit and twenty-year window	¥18m book-value lifetime limit; growth quota max ¥12m

Policy sources: Financial Services Agency [S01, S35].

This institutional change matters for interpretation. A large rise in 2024 purchase amounts is not, by itself, proof of a comparable rise in the number of investors or a causal policy effect because the amount that an existing investor could place into NISA also increased sharply. The analysis therefore separates account growth, purchase growth, age penetration and household/firm evidence rather than treating one metric as sufficient. [S01; S05]

2. Data and Methodology

The project uses official Japanese sources wherever possible: the Financial Services Agency for NISA statistics and policy definitions; the Japan Securities Dealers Association for securities-company statistics, age distributions and investor surveys; the Statistics Bureau of Japan for population and CPI; and the Bank of Japan for household Flow of Funds and monetary-policy context. Firm-level analysis uses company investor-relations disclosures. TOPIX historical prices are taken from a secondary market-data history and are explicitly labeled as such in the source log. The workbook contains the complete source registry and a variable-by-variable dictionary. [S01-S35]

2.1 Pre/post design

The core comparison treats 2023 as the final pre-reform benchmark and 2024-2025 as post-reform observations, while using longer history to establish whether 2024 represented an acceleration relative to prior trends. For national accounts and securities-company accounts, the immediate baseline is average year-over-year growth during 2020-2023. For securities-company purchases, the benchmark is average annual purchases during 2019-2023. These are descriptive trend benchmarks, not synthetic counterfactuals.

Key derived measures are:

- $\text{Account growth}_t = \text{Accounts}_t / \text{Accounts}_{(t-1)} - 1$
- $\text{Account acceleration}_{2024} = 2024 \text{ account growth} - \text{average } 2020\text{-}2023 \text{ account growth}$
- $\text{Annual securities-company purchases}_t = \text{cumulative purchases}_t - \text{cumulative purchases}_{(t-1)}$, when the cumulative series is available
- $\text{2024 purchase multiple} = 2024 \text{ annual securities-company purchases} / \text{average } 2019\text{-}2023 \text{ annual purchases}$
- $\text{Age penetration} = \text{NISA accounts in age cohort} / \text{population in corresponding age cohort}$ (direct published rates are preferred where available)

The workbook audit sheet independently reconciles quota totals, age components, annual purchase differences, growth rates and scenario formulas. All final audit tests pass within stated tolerances; small age-component differences are explicitly treated as source rounding, not silently forced to total.

3. National Participation: A Clear 2024 Break

Figure 1. All-institution NISA accounts, 2014-2025

Source: JSDA/FSA historical and final NISA statistics [S02, S03, S06, S07].

National NISA accounts increased from 21.25 million in 2023 to 25.59 million in 2024 and 28.21 million in 2025. That is a 20.42% launch-year increase and a 32.75% increase over the two years after the reform benchmark. The average national account growth rate during 2020-2023 was 11.89%, making 2024 growth 8.53 percentage points higher than that recent baseline. [S02; S03; S06; S07; workbook 03_Clean_NISA]

Securities-company NISA accounts show an even larger launch-year acceleration: 14.28 million in 2023, 18.03 million in 2024 and 20.25 million in 2025. The 2024 growth rate was 26.26%, compared with an average 16.02% during 2020-2023, an acceleration of 10.24 percentage points. By 2025, the securities-company account stock was 41.81% above 2023. [S03; workbook 03_Clean_NISA]

Figure 2. Annual NISA purchases at securities companies

Source: cumulative securities-company NISA purchases through 2024 and final direct 2025 annual purchase data [S03].

Purchase flows provide the strongest visual break. Securities-company annual NISA purchases were ¥3.8488 trillion in 2023 and ¥14.0447 trillion in 2024, a 264.91% increase. The 2019-2023 average was ¥2.76294 trillion, so 2024 purchases were 5.083x that recent pre-reform average. Purchases rose a further 9.32% to ¥15.3540 trillion in 2025 rather than reverting toward the old-regime range. [S03; workbook 03_Clean_NISA]

This supports H1 strongly as a descriptive claim. It does not, however, mean the policy caused a 264.9% increase in underlying risk appetite: the statutory annual investment capacity increased dramatically, and market/macro conditions were favorable to investment activity. Account counts are therefore the cleaner participation measure, while purchases capture both participation and investment intensity. [S01; S05; S17-S21]

4. Younger Investors: Strong Evidence, but Not a Simple Age Gradient

Figure 3. NISA account growth by age cohort

Sources: final FSA age-account data [S02, S06, S07]. The <=20s cohort is merged for pre/post comparability.

Cohort	2023 accts	2024 accts	2025 accts	23 → 24 growth	24 → 25 growth
<=20s	2.31m	3.07m	3.50m	32.7%	14.1%
30s	3.71m	4.49m	4.95m	21.0%	10.2%
40s	4.04m	4.92m	5.38m	21.7%	9.3%
50s	3.95m	4.95m	5.53m	25.5%	11.7%
60s	3.19m	3.77m	4.18m	18.3%	10.7%
70s	2.63m	2.84m	3.08m	8.0%	8.4%
80+	1.38m	1.54m	1.59m	12.1%	3.0%

Source: final FSA age-account statistics [S02, S06, S07].

The <=20s merged cohort grew 32.71% from 2023 to 2024, the fastest proportional account growth of the age groups available on a consistent basis. The 50s cohort was second at 25.51%, followed by the 40s at 21.72% and 30s at 21.01%. This is why H2 should be described carefully: younger adoption was unusually strong, but the reform also attracted older working-age investors. [S02; S06; S07]

Figure 4. Direct NISA penetration by age, 2024 and 2025

Source: JSDA New NISA White Papers [S04, S34]. Population base: Oct-2024 for both published series.

Direct penetration confirms broad working-age adoption. In 2025, penetration was 26.4% for people in their 20s, 37.3% for the 30s, 32.9% for the 40s, 30.3% for the 50s and 28.1% for the 60s. From 2024 to 2025, the largest penetration increase was in the 30s (+3.5 percentage points), followed by the 20s (+3.3), 50s (+3.2), 40s (+2.8) and 60s (+2.7). [S04; S34]

Investment style differs by age as well. In 2024, the accumulation quota represented about 46.9% of purchases for the ≤20s cohort and about 40.3% for the 30s, versus roughly 20.5% for the 60s and 5.0% for investors 80 and older. This supports the strategic importance of recurring, low-cost digital investing for platforms seeking younger customers. [S34]

Survey context is directionally consistent: among surveyed NISA account openers, 22.7% reported no securities-purchase experience before opening NISA, rising to 32.8% among respondents in their 30s or younger. This is not a national population estimate, but it supports a plausible mechanism in which NISA serves as an entry point for first-time investors. [S33]

5. What Are Investors Buying, and Is Household Allocation Changing?

5.1 The accumulation quota is gaining importance

Across all institutions, New NISA purchases increased from ¥17.3821 trillion in 2024 to ¥18.7487 trillion in 2025. The accumulation quota rose from ¥4.9677 trillion to ¥6.2349 trillion, increasing its share of total purchases from 28.58% to 33.26%. The growth quota was nearly flat in absolute terms, rising from ¥12.4144 trillion to ¥12.5138 trillion. [S02; S03; S06]

Investment funds dominate New NISA. In 2025, funds represented about 67% of all New NISA purchases and 74% of New NISA balances. Within the accumulation quota, index funds represented 87.7% of purchases. These figures reinforce the importance of recurring index-fund distribution rather than a business model based only on stock-trading commissions. [S03; S04]

5.2 Household allocation moved in the same direction, with a major caveat

Figure 5. Household asset-allocation snapshots

Sources: BOJ/FSA household asset-composition snapshots [S10, S11, S12]. Shares are rounded and drawn from different publication vintages.

The household balance-sheet evidence is consistent with a gradual shift toward market-linked assets. Cash and deposits represented 52.6% of household financial assets at end-2023 and 49.0% at end-September 2025, while equities plus investment trusts increased from 17.9% to 22.0%. Separately, an FSA broad market-linked proxy increased from 20.1% in 2023 to 22.4% in 2024. [S10-S13]

This should not be interpreted as a direct measurement of money transferred from bank deposits into NISA. BOJ Flow of Funds separates transactions, stocks and reconciliation, and changes in stock values can reflect market-price movements. Strong Japanese equity returns during 2023-2025 make this distinction especially important. [S09; S17]

A JSDA survey adds behavioral context: 74.9% of 7,610 surveyed New NISA users cited deposits, salary income or pension as a funding source. Because this is a multiple-response category that mixes existing deposits with current income, it supports the presence of new household funding but cannot identify a yen amount of deposit outflow. [S32]

6. Market and Macro Context: Why Causality Must Be Qualified

Year	CPI index	CPI inflation	TOPIX year-end	TOPIX price return
2023	105.6	3.2%	2,366.39	25.09%
2024	108.5	2.7%	2,784.92	17.69%
2025	111.9	3.2%	3,408.97	22.41%

CPI: Statistics Bureau of Japan [S14-S16]. TOPIX historical prices: Kabutan [S17]; index definition: JPX [S18].

Japanese equities were already performing strongly before the 2024 reform and continued to rise afterward. At the same time, the BOJ ended its negative-rate/yield-curve-control framework in March 2024, raised the policy rate to around 0.25% in July 2024 and to around 0.5% in January 2025. Inflation also remained positive. These conditions can affect retail-investor attention, the valuation of household financial assets, and brokerage revenue through trading, FX and financial income. [S14-S21]

A formal causal estimate would require a credible untreated comparison group or quasi-experimental variation that is not available in the aggregate public series used here. The project therefore focuses on magnitude, timing, cohort composition and business implications rather than presenting a causal coefficient.

7. Implications for Japanese Financial Institutions

The reform creates multiple economic channels: more funded accounts, higher recurring fund balances, higher custody and deposited assets, more cross-selling opportunities, financial/interest income on customer cash, FX and ancillary activity, advisory fees and asset-management manufacturing. The best-positioned firm depends on which channel is emphasized.

Firm	Direct NISA evidence	Asset / flow evidence	Primary benefit channel	Key comparability caveat
Rakuten Securities	~6.99m NISA accounts at 2025 YE; 7.92m at Jun-2026	¥48.7tn deposited assets in 2025	Digital acquisition, fund balances, financial income, FX/ecosystem	Company KPIs; 2026 is context after core period
SBI Securities	>5m NISA accounts by Jun-2024; 5.365m Dec-2024	Investment-trust custody >¥15tn Jul-2024; >¥30tn May-2026	Scale, recurring funds, financial income, ancillary services	Group/customer-asset perimeter differs from Rakuten
Nomura	NISA series has a definition break	Recurring-revenue assets ¥23.5tn; FY2024/25 inflows ¥1.374tn	Advice, managed assets, lending, recurring fees	NISA account definition changed in 2024
Daiwa	Indirect through NISA-eligible products	FY2024 NISA-eligible fund inflows ¥1.03tn; ~7% share	Asset-management/product manufacturing	Not directly comparable to broker account counts

Company sources: Rakuten [S22-S24], SBI [S25-S28], Nomura [S29-S30], Daiwa [S31].

7.1 Rakuten Securities

Rakuten provides the cleanest disclosed combination of digital customer scale, NISA accounts, deposited assets and standalone financials for a scenario analysis. General accounts increased from 10.20 million in 2023 to 11.93 million in 2024 and 13.26 million in 2025. NISA accounts were approximately 6.00 million in 2024 and 6.99 million in 2025, while deposited assets reached ¥48.7 trillion in 2025. Rakuten Securities Inc. operating revenue increased from ¥110.877 billion in 2023 to ¥158.340 billion in 2025, and net income attributable to owners increased from ¥17.356 billion to ¥21.699 billion. [S22; S23]

As of June 2026, Rakuten Securities reported 14.39 million general accounts, up 14.5% year over year, and 7.92 million NISA accounts, up 21.3%. The company also reported its highest-ever quarterly operating income, citing financial income in an active market environment and higher fees received on accumulating investment-trust balances and other products. This directly illustrates how a zero/low-commission brokerage can monetize customer and asset growth outside traditional stock commissions. [S24]

7.2 SBI Securities

SBI is the strongest direct peer. NISA accounts surpassed 5 million by June 2024 and were reported at 5.365 million in December 2024 on the group presentation perimeter. Investment-trust custody exceeded ¥15 trillion in July 2024 and ¥30 trillion by May 2026. SBI also reported that first-half 2024 NISA fund sales were about 6.6 times the prior-year level and that the recurring fund-setting amount in June 2024 was about 3.7 times the June 2023 level. These are unusually direct links between New NISA and recurring-investment economics. [S25-S28]

7.3 Nomura and Daiwa

Nomura is better evaluated through recurring-revenue assets than through a raw NISA-account comparison because its NISA disclosure definition changed in 2024. Recurring-revenue assets were ¥23.5 trillion at March 2025, with FY2024/25 net inflows of ¥1.374 trillion. Daiwa provides a product-manufacturing perspective: FY2024 NISA-eligible fund inflows were ¥1.03 trillion, about 7% of the industry total reported by Daiwa, and the balance of NISA-eligible public equity investment trusts reached ¥3.4 trillion. [S29-S31]

8. Evidence-Anchored Rakuten Securities Bear / Base / Bull Scenario

The scenario is deliberately simple and auditable. It forecasts Rakuten Securities general accounts, revenue per account, revenue and net income using observed historical growth/margin anchors. It then applies the 16.2x-19.8x PER range disclosed by Daiwa Securities in May 2026 valuation work for Rakuten Securities Holdings. The PER range is therefore evidence-based rather than invented, but the legal/perimeter mismatch means the output is an illustrative valuation sensitivity, not a formal stand-alone equity value. [S22-S24]

Driver	Bear	Base	Bull	Evidence rule
Annual account growth	10.24%	11.15%	14.50%	2025 national NISA growth / Rakuten 2025 actual / Rakuten 2026H1 observed YoY
Revenue/account growth	0.32%	4.91%	9.50%	Rakuten 2024 actual / average 2024-25 / Rakuten 2025 actual
Net margin	12.40%	13.92%	15.65%	Rakuten 2024 actual / 2023-25 average / highest 2023-25 actual
PER sensitivity	16.2x	18.0x	19.8x	Daiwa Rakuten Securities HD transaction-valuation range

Sources and calculations: Rakuten [S22-S24]; national NISA account growth [S02, S03].

Figure 6. Rakuten Securities 2028 net-income proxy by scenario

Author calculations from sourced historical drivers. Full formulas and assumptions are in 10_Rakuten_Scenario of the workbook.

2028 scenario	Accounts (m)	Revenue (¥bn)	Net income proxy (¥bn)	18.0x sensitivity (¥bn)	Interpretation
Bear	17.76	214.2	26.5	477.9	Conservative account growth; nearly flat monetization per account
Base	18.21	251.0	34.9	628.9	Rakuten 2025 customer growth and average recent monetization growth
Bull	19.90	312.1	48.9	879.3	2026H1 customer growth and 2025 monetization growth persist

The base case produces approximately 18.21 million accounts, ¥251.0 billion of operating revenue and ¥34.9 billion of net income in 2028, with a mechanical 18.0x PER sensitivity of about ¥628.9 billion. The bear and bull 18.0x sensitivities are approximately ¥477.9 billion and ¥879.3 billion, respectively. These values are scenario outputs, not price targets or company guidance.

9. Limitations and Robustness

Causality: The analysis documents timing and magnitude but does not have a credible untreated control group. The reform coincided with higher statutory limits, strong equity markets and monetary-policy changes.

Program comparability: Old and New NISA are not identical programs. Account counts are more comparable than purchase intensity because contribution limits changed materially.

Age categories: The pre/post <=20s series combines teens and 20s. Direct penetration analysis therefore uses the published separate 2024/2025 age rates, while reconstructed 2023 penetration is supporting only.

Rounding: Public age-account and age-purchase tables are rounded. The workbook preserves expected rounding differences rather than forcing components to equal headline totals.

Household balance sheets: Flow-of-Funds stock changes contain transactions, valuation and reconciliation. They cannot identify a direct yen flow from deposits into NISA.

Survey evidence: Survey results are contextual and sample-specific. Multiple-response funding data cannot be treated as population transaction shares.

Firm comparability: Companies disclose different account, AUM, revenue and NISA definitions. The project therefore uses an evidence matrix rather than an artificial standardized ranking.

Forecasting: Bear/base/bull assumptions are anchored to observed history, but the model holds growth/margins constant within each case and does not forecast detailed revenue lines, capital requirements or balance-sheet items.

Robustness is handled through source hierarchy and mechanical audit rather than by adding unsupported econometric complexity. Final 2025 FSA/JSDA figures supersede preliminary figures. The workbook contains 26 explicit numerical audit checks, all passing within documented tolerances, plus a formula-error scan with no spreadsheet errors.

10. Conclusion

The central research question can be answered affirmatively but with disciplined wording: Japanese retail-investor participation increased materially around the 2024 New NISA expansion, and the increase was large relative to the recent pre-reform trend. National accounts rose 20.4% in the launch year, securities-company accounts rose 26.3%, and securities-company purchase flows rose 264.9%. The persistence of account and purchase growth into 2025 argues against the result being merely a one-quarter launch effect. [S02; S03; S06; S07]

Younger investors were important to that expansion. The youngest merged cohort experienced the fastest launch-year account growth, the 30s reached the highest direct penetration, and younger cohorts allocated a larger share of 2024 purchases through the accumulation quota. Still, the 50s also grew strongly, so the more accurate interpretation is a broadening of participation across working-age Japan with especially strong younger adoption. [S04; S05; S34]

The firm-level implication is that New NISA can deepen the economics of retail financial relationships even in a low-commission environment. The most scalable beneficiaries can acquire customers digitally and then monetize recurring fund balances, custody/assets, interest and financial income, FX, ancillary products and ecosystem cross-use. Rakuten and SBI show the strongest direct evidence in the disclosed data; Nomura and Daiwa capture the same structural trend through advice, recurring assets and investment-product manufacturing. [S22-S31]

The project therefore supports the thesis that the 2024 reform marked a meaningful structural expansion of Japanese retail investing while avoiding the stronger claim that NISA alone caused every observed change. That distinction is central to the credibility of the analysis.

Appendix A. Variable Key and Workbook Map

The companion workbook contains the complete variable dictionary in 11_Variable_Dict. The table below summarizes the most important variables used in the written report.

Variable ID	Definition	Unit	Construction / Source	Use
NISA_ACCTS_ALL	All-institution NISA accounts	m accounts	FSA/JSDA year-end stock	National participation
NISA_ACCTS_SEC	Securities-company NISA accounts	m accounts	JSDA year-end stock	Brokerage participation
SEC_ANN_PURCHASE	Annual securities-company NISA purchases	¥tn	Cumulative difference / direct 2025 final	Investment intensity
ACCT_ACCEL_ALL	2024 national account growth minus 2020-23 average	percentage points	Calculated	Pre/post acceleration
PURCHASE_MULTIPLE_PRE	2024 annual purchases / 2019-23 average	x	Calculated	Scale of purchase break
AGE_GROWTH_24	2024 age-account growth	%	2024 accounts / 2023 accounts - 1	Younger-investor test
AGE_PEN_2025	Direct 2025 age penetration	%	Published JSDA/FSA rate	Population-adjusted adoption
AGE_ACCUM_SHARE	Accumulation / total 2024 purchases by age	%	Calculated from rounded source components	Recurring-investment behavior
HH_CASH_SHARE	Cash and deposits / household financial assets	%	BOJ/FSA snapshot	Savings-to-investment context
HH_EQFUND_SHARE	Equity + investment trusts share	%	Calculated	Market-linked household allocation
RKT_REVENUE	Rakuten Securities operating revenue	¥bn	Company financials	Scenario base
RKT_NET_INCOME	Rakuten Securities net income	¥bn	Company financials	Scenario earnings

Variable ID	Definition	Unit	Construction / Source	Use
SCEN_ACCT_GROWTH	Bear/base/bull annual account growth	%	Evidence-anchored assumption	Forecast driver
SCEN_REVPACCT_GROWTH	Bear/base/bull revenue/account growth	%	Evidence-anchored assumption	Forecast monetization
SCEN_PER_LOW/MID/HIGH	PER sensitivity	x	16.2x / 18.0x / 19.8x	Illustrative valuation sensitivity

Appendix B. Complete Source Registry

Source IDs below match the workbook. The workbook also records each source's use, vintage and caveat. URLs are included so every source used can be independently checked.

Appendix C. Reproducibility and Audit Trail

The companion Excel workbook is the reproducible model. It contains:

- 01_Source_Log: complete source registry and caveats;
- 02_Raw_NISA: sourced historical, quota, age and population inputs;
- 03_Clean_NISA: formula-driven pre/post analysis;
- 04_Age_Data and 05_Product_Mix: cohort and product analysis;
- 06_HH_Assets, 07_Survey_Context and 08_Macro_Market: household and context variables;
- 09_Firm_Comparison: company evidence matrix;
- 10_Rakuten_Scenario: evidence-anchored bear/base/bull model;
- 11_Variable_Dict: complete key for raw inputs, formulas and assumptions; and
- 12_Audit_Checks: numerical reconciliations and tolerances.

Spreadsheet color convention: blue = hardcoded/source input; green = inter-sheet formula link; black = formula/calculation; yellow fill = forecast assumption. This allows any reviewer to trace a result from the written report back to the source input and formula.
